

Recyclable Object:

Plastic Bottle

The plastic bottle, is one of the most common recyclable objects around the world. It is made of polyethylene terephthalate (PET), a type of plastic that can be recycled many times.

Task to recycle or reuse:

1. Clean the bottle and wash it to evade infections.
2. Remove the label and cap.
3. You can reuse it inserting coins or any other things, such as rocks or any thing in your mind.
4. If you prefer recycling instead of reusing, you can place the washed bottle in the plastic recycling bin. And it would be transformed into new products such as fibers for clothes, or even new bottles.

Non-Recyclable Object:

Toilet Paper:

The toilet paper is a common household product that is impossible to recycle or reuse because of hygiene and contamination issues.

When someone uses the toilet paper, it absorbs water and other organic materials. These substances break down the paper fibers, so it cannot be separated.

The correct way to handle used toilet paper is to throw it into the trash bin. In some cases, if you have a composting system designed for organic waste, certain types of unbleached or biodegradable toilet paper can be composted.

However, most standard toilet paper must be discarded in the regular waste.
